

Bone void filling

Bioabsorbable synthetic bone substitutes

- ▶ Bioabsorbable and osteoconductive
- ▶ Wide range of products
- ▶ Ready to use

Pure Tricalcium Phosphate

SBM, a European pioneer in synthetic bone substitutes with more than 20 years of experience, has developed a complete range of fully absorbable synthetic implants for bone void filling.

By totally controlling its technique in biomaterials, SBM provides high purity β -TCP (Tricalcium Phosphate) implants that are ready to use as cancellous or cortico-cancellous bone.

An implant for each indication

Bio 1[®] is declined in a complete range adapted to specific indications.

Biosorb, a renowned material

Ensuring safety

Synthetic ¹⁻¹¹

Biosorb does not contain any organic phase: no risk of viral contamination from human or animal origin (AIDS, hepatitis, bovine and ovine BSE).

Biocompatible ¹⁻¹¹

Composed of high-purity materials, close from the bone mineral components, Biosorb is perfectly tolerated by the organism. To this day, no allergic reaction or toxicity linked to the material has been reported.

Mechanical resistance ¹⁻¹¹

Bio 1[®] implants were designed and adapted in terms of shape and porosity for each indication and tested in our laboratory. The porosity ranges from 30 to 70%, which offers a mechanical strength similar to the one of cortical bone subjected to compression (up to 45 MPa).

Securing results

Bioactivity ¹²⁻²²

A genuine chemical bond without fibrous interlaying is developed with the bone tissue, without fibrous encapsulation nor inflammation.

Osteoconduction ¹²⁻²²

Complete control of the macroporosity guides bone cell penetration and improves bone graft integration within the bone tissue.

Resorption ¹²⁻²²

Bio 1[®] implants are made of bioabsorbable synthetic Tricalcium Phosphate. Implants are thus replaced by healthy new-formed bone once the cellular resorption process is complete.
